The purpose of this manual is twofold: one, to provide the installer with the basic directions and recommendations for the proper installation and adjustment of the water heater; and two, for the owner-operator, to explain the features, operation, safety precautions, maintenance and troubleshooting of the water heater. This manual also includes a parts list.

It is imperative that all persons who are expected to install, operate or adjust this water heater read the instructions carefully so they may understand how to perform these operations. If you do not understand these instructions or any terms within it, seek professional advice.

Any questions regarding the operation, maintenance, service or warranty of this water heater should be directed to the seller from whom it was purchased. If additional information is required, refer to the section on “If you need service.”

DO NOT destroy this manual. Please read carefully and keep in a safe place for future reference.

⚠️ Recognize this symbol as an indication of Important Safety Information!
FOR YOUR RECORDS

Write the model and serial numbers here:

#
#

You can find them on a label on the appliance.

Staple sales slip or cancelled check here.

Proof of the original purchase date is needed to obtain service under the warranty.

READ THIS MANUAL

Inside you will find many helpful hints on how to use and maintain your water heater properly. Just a little preventive care on your part can save you a great deal of time and money over the life of your water heater.

You’ll find many answers to common problems in the Before You Call For Service section. If you review our chart of Troubleshooting Tips first, you may not need to call for service at all.

READ THE SAFETY INFORMATION

Your safety and the safety of others are very important. There are many important safety messages in this manual and on your appliance. Always read and obey all safety messages.

This is the safety alert symbol. Recognize this symbol as an indication of Important Safety Information!

This symbol alerts you to potential hazards that can kill or hurt you and others.

All safety messages will follow the safety alert symbol and either the word “DANGER”, “WARNING”, “CAUTION” or “NOTICE”.

These words mean:

⚠️ DANGER 🟤 An imminently hazardous situation that will result in death or serious injury.

⚠️ WARNING 🟤 A potentially hazardous situation that could result in death or serious injury and/or damage to property.

⚠️ CAUTION 🟤 A potentially hazardous situation that may result in minor or moderate injury.

NOTICE: 🚩 Attention is called to observe a specified procedure or maintain a specific condition.
DANGER!

WATER TEMPERATURE SETTING

Safety and energy conservation are factors to be considered when selecting the water temperature setting of water heater. Water temperatures above 125°F (52°C) can cause severe burns or death from scalding. Be sure to read and follow the warnings outlined on the label pictured below. This label is also located on the water heater near the thermistor access panel.

Time/Temperature Relationship in Scalds

<table>
<thead>
<tr>
<th>Temperature</th>
<th>Time To Produce a Serious Burn</th>

Table courtesy of Shriners Burn Institute

The chart shown above may be used as a guide in determining the proper water temperature for your home.

DANGER: Households with small children, disabled, or elderly persons may require a 120°F (49°C) or lower thermostat setting to prevent contact with “HOT” water.

The temperature of the water in the heater is regulated by the water heater interface control. To comply with safety regulations the temperature was set at 120°F (49°C) before the water heater was shipped from the factory.

The illustration below shows the water temperature setting.

Refer to the Operating Instructions in this manual for detailed instructions in how to adjust the water temperature.

DANGER: Hotter water increases the potential for Hot Water SCALDS.

NOTICE: Mixing valves are recommended for reducing point of use water temperature by mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed. See page 16 for more details and contact a licensed plumber or the local plumbing authority for further information.

When used in demand response applications a thermostatic mixing valve conforming to ASSE 1017 shall be installed on the hot water supply line following all manufacturer installation instructions. See page 32 for additional installation information.
IMPORTANT SAFETY INFORMATION.
READ ALL INSTRUCTIONS BEFORE USING.

⚠️ WARNING!
For your safety, the information in this manual must be followed to minimize the risk of fire or explosion, electric shock, or to prevent property damage, personal injury, or loss of life.

Be sure to read and understand the entire Use and Care Manual before attempting to install or operate this water heater. It may save you time and cost. Pay particular attention to the Safety Instructions. Failure to follow these warnings could result in serious bodily injury or death. Should you have problems understanding the instructions in this manual, or have any questions, STOP, and get help from a qualified service technician, or the local electric utility.

FOR INSTALLATIONS IN THE STATE OF CALIFORNIA
California Law requires that all new and replacement water heaters, and all existing residential water heaters, must be braced, anchored, or strapped to resist falling or horizontal displacement due to earthquake motion. At a minimum, any water heater shall be secured in accordance with the California Plumbing Code, or modifications made thereto by a city, county, or city and county pursuant to Section 17958.5. Generic instructions for California titled “Guidelines for Earthquake Bracing Residential Water Heaters” can be obtained by:

- Writing the California, Department of General Services, Division of State Architect, 1102 Q Street, Suite 5100, Sacramento, CA 95814
- Calling (916) 445-8100
- Following web address: https://www.dgs.ca.gov/-/media/Divisions/DSA/Publications/gas_shutoff/waterheaterbracing

SAFETY PRECAUTIONS
Have the installer show you the location of the circuit breaker and how to shut it off if necessary. Turn off the circuit breaker if the water heater has been subjected to overheating, fire, flood, physical damage or if the ECO (temperature limiting control) fails to shut off.

- Read this manual entirely before installing or operating the water heater.
- Use this appliance only for its intended purpose as described in this Use and Care Manual.
- Be sure your appliance is properly installed in accordance with local codes and the provided installation instructions.

⚠️ WARNING!
Disconnect all power to unit before starting maintenance. Failure to do so can cause electrical shock resulting in severe personal injury or death.

⚠️ WARNING!
FLAMMABLE CONTENTS UNDER PRESSURE. The compressor is not a serviceable part. The compressor wiring terminals may arc allowing pressurized refrigerant and oil to escape, ignite and cause serious bodily injury, severe burns or death.

READ AND FOLLOW THIS SAFETY INFORMATION CAREFULLY.

SAVE THESE INSTRUCTIONS

Refrigerant
This Hybrid Water Heater is factory charged with an environmentally friendly, non-chlorinated refrigerant, R134A. This refrigerant has zero ozone depletion potential.
Installing the water heater

The location chosen for the water heater must take into consideration the following:

Local Installation Regulations

This water heater must be installed in accordance with these instructions, local codes, utility codes, utility company requirements or, in the absence of local codes, the latest edition of the National Electrical Code. It is available from some local libraries or can be purchased from the National Fire Protection Association, Batterymarch Park, Quincy, MA 02269 as booklet ANSI/NFPA 70.

Canadian installations should refer to CSA22.1, a copy can be purchased from the Canadian Standards Association, 5050 Spectrum Way, Mississauga, ONT L4W 5N6

Location

Locate the water heater in a clean dry area as near as practical to the area of greatest heated water demand. Long un-insulated hot water lines can waste energy and water.

Place the water heater in such a manner that the thermistor and element access panels can be removed to permit inspection and servicing such as removal of elements or checking controls.

The water heater and water lines should be protected from freezing temperatures. DO NOT install the water heater in outdoor, unprotected areas.

Make certain the floor underneath the water heater is strong enough to sufficiently support the weight of the water heater once it is filled with water.

Floor isolation kit is recommended to minimize vibrations (where applicable).

⚠️ CAUTION: The water heater should not be located in an area where leakage of the tank or connections will result in damage to the area adjacent to it or to lower floors of the structure. Where such areas cannot be avoided, it is recommended that a suitable drain pan, adequately drained, be installed under the water heater.

NOTICE: Installation in a confined space will lead to higher power consumption if adequate ventilation is not provided.

It is recommended that the hybrid water heater be installed where ambient temperatures DO NOT exceed 145°F (63°C). Insufficient air exchange will result in increased energy consumption levels.

\[A—\text{Diameter of water heater plus 4" min.}\]
\[B—\text{Maximum 2"}\]

\[\text{To open drain, line should be at least 3/4" ID and pitched for proper drainage.}\]

NOTICE: Auxiliary drain pan MUST conform to local codes.

Drain Pan Kits are available from the store where the water heater was purchased, or any water heater distributor.

Drain Pan should not obstruct cold inlet or drain valve.

Inspect Shipment

Inspect the water heater for possible damage. Check the markings on the rating plate of the water heater to be certain the power supply corresponds to the water heater requirements. Rating plate is located on front of water heater.
Installing the water heater

Locations that provide optimal efficiency

**Heater: Not Ducted**
Room size: Larger than 700 ft³ (e.g. 7' x 10' x 10').
Requirements: No additional ventilation needed.

**Heater: Not Ducted**
Room size: Smaller than 700 ft³ (e.g. 7' x 10' x 10').
Requirements: Full louvered door OR two louvers top and bottom. See below.

**Heater: Not ducted**
Room: Small Closet
Requirements:
* Air gap under door equal to 18 in² (0.75" clearance).
* Louver must be located the same height on door as the air exhaust on heater.
* Heater air exhaust must be positioned towards louver within one foot of door.

**Heater: Ducted with inlet OR outlet duct**
Room size: Any size room
Requirements: Air gap under door equal to 18 in² (0.75" clearance)

**Heater: Ducted with inlet AND outlet duct**
Room size: Any size room
Requirements: No additional ventilation needed.

---

**NOTICE:** If air temperature in installed location drops more than 15°F (8°C) during heating, air circulation is insufficient for efficient operation. Utilize ducting to direct cold exhaust air to another location.
Thermal Expansion

Determine if a check valve exists in the inlet water line. Check with your local water utility. It may have been installed in the cold water line as a separate back flow preventer, or it may be part of a pressure reducing valve, water meter or water softener. A check valve located in the cold water inlet line can cause what is referred to as a "closed water system". A cold water inlet line with no check valve or back flow prevention device is referred to as an "open" water system.

As water is heated, it expands in volume and creates an increase in the pressure within the water system. This action is referred to as "thermal expansion". In an "open" water system, expanding water which exceeds the capacity of the water heater flows back into the city main where the pressure is easily dissipated.

A "closed water system", however, prevents the expanding water from flowing back into the main supply line, and the result of "thermal expansion" can create a rapid and dangerous pressure increase in the water heater and system piping. This rapid pressure increase can quickly reach the safety setting of the relief valve, causing it to operate during each heating cycle. Thermal expansion, and the resulting rapid and repeated expansion and contraction of components in the water heater and piping system can cause premature failure of the relief valve, and possibly the heater itself. Replacing the relief valve WILL NOT correct the problem!

The suggested method of controlling thermal expansion is to install an expansion tank in the cold water line between the water heater and the check valve (refer to the illustration on the next page). The expansion tank is designed with an air cushion built in that compresses as the system pressure increases, thereby relieving the over pressure condition and eliminating the repeated operation of the relief valve. Other methods of controlling thermal expansion are also available. Contact your installing contractor, water supplier or plumbing inspector for additional information regarding this subject.

NOTICE: The inlet and outlet water nipple remain with the black markings pointed up.

Water Supply Connections

Refer to the illustration on the next page for suggested typical installation. The installation of flexible connectors is recommended on the hot and cold water connections. Flexible connections provide vibration isolation and allow the water heater to be easily disconnected for servicing if necessary. The HOT and COLD water connections are clearly marked and are 3/4in. NPT on all models. Install a shut-off valve in the cold water line near the water heater.

NOTICE: DO NOT apply heat to the HOT or COLD water connections. If sweat connections are used, sweat tubing to adapter before fitting adapter to the water connections on heater. Any heat applied to the water supply fittings will permanently damage the dip tube and/or heat traps.

See page 9 on "To Fill The Water Heater".

Condensate Drains

Consult local codes or ordinances for specific requirements. Refer to page 5.

IMPORTANT: When making drain fitting connections to the drain tubing, use a thin layer of piping tape or silicone and install hand tight.

IMPORTANT: When making drain fitting connections to the drain tubing, DO NOT overtighten. Overtightening fittings can split pipe connections on the drain pan.

- This unit is equipped with a 3/4" NPT female primary condensate connection. Use MIP fittings for connections.
- DO NOT reduce drain line size less than connection size provided on condensate drain.

- All drain lines must be pitched downward away from the unit a minimum of 1/8" per foot of line to ensure proper drainage.
- Drain lines must include a P-trap if connected to a sewer pipe.
- If no drain is available, then a common condensate pump with a capacity no less than 2 gallon per day must be installed.
- DO NOT allow condensate to drain into the water heater drain pan.
- The drain line should be insulated where necessary to prevent sweating and damage due to condensate forming on the outside surface of the line.
Installing the water heater

Typical Installation

A new combination temperature and pressure relief valve, complying with the Standard for Relief Valves for Hot Water Supply Systems, ANSI Z21.22/CSA 4.4, is factory installed and must remain in the opening provided and marked for the purpose on the water heater. No valve of any type should be installed between the relief valve and the tank.

⚠️ WARNING: The pressure rating of the relief valve must not exceed 150 PSI, the maximum working pressure of the water heater as marked on the rating plate.

Relief Valve

The btu/h rating of the relief valve must not be less than the input rating of the water heater as indicated on the rating label located on the front of the heater (1 watt=3.412 btu/h).

Connect the outlet of the relief valve to a suitable open drain so that the discharge water cannot contact live electrical parts or persons and to eliminate potential water damage.

Piping used should be of a type approved for hot water distribution. The discharge line must be no smaller than the outlet of the valve and must pitch downward from the valve to allow complete drainage (by gravity) of the relief valve and discharge line. The end of the discharge line should not be threaded or concealed and should be protected from freezing. No valve of any type, restriction or reducer coupling should be installed in the discharge line.

⚠️ WARNING: DO NOT connect other plumbing to the T&P plumbing; it must go directly to a suitable open drain. DO NOT connect the T&P plumbing to the condensate plumbing.
**To Fill the Water Heater**

Make certain the drain valve on the water heater is completely closed.

Open the shut-off valve in the cold water supply line.

Open each hot water faucet slowly to allow the air to vent from the water heater and piping.

A steady flow of water from the hot water faucet(s) indicates a full water heater.

---

**LeakGuard™**

This water heater is equipped with built-in leak detection and automatic water shut off valve. The leak detection device (LeakSense™) detects the presence of water and immediately alerts the electronic control as the EcoNet app on the cellular phone. When water is detected, the electronic controls will shut down the heating elements and the automatic water shut off valve closes.

---

**Self Check**

The automatic water shut off valve has a self check feature which runs every 30 days once the water heater is powered on. This feature works by closing and reopening the automatic water shut off valve. In case the valve fails to reopen, the water heater will be DISABLED. The water heater gives alert when the automatic water shut off valve fails to close.

---

**EcoNet™ Communication**

EcoNet™ communication is provided for integration with home automation, energy management, and demand response systems. Connectivity is provided through the via wireless (Wi-Fi).

---

**Electrical Connections**

** WARNING: Turn off electric power at the fuse box or service panel before making any electrical connections.**

Also, the ground connection must be completed before making line voltage connections. Failure to do so can result in electrical shock, severe personal injury or death.

Disconnect all power to unit before starting maintenance. Failure to do so can cause electrical shock resulting in severe personal injury or death.

The unit must be grounded. Failure to do so can cause electrical shock resulting in severe personal injury or death.

If the water heater has been subjected to fire, flood or physical damage, **DO NOT** operate the water heater again until it has been checked by a qualified service technician.

**NOTICE: DO NOT use this appliance if any part has been under water. Immediately call a qualified installer or service agency to replace a flooded water heater. DO NOT attempt to repair the unit! It must be replaced.**
Installing the water heater

Electrical Connections continued...

A separate branch circuit with copper conductors, overcurrent protective device and suitable disconnecting means must be provided by a qualified electrician.

All wiring must conform to local codes or latest edition of National Electrical Code ANSI/NFPA 70.

The water heater is completely wired to the junction box inside jacket at the top front of the water heater. An opening for 1/2 in. or 3/4 in. electrical fitting is provided for field wiring connections.

The voltage requirements and wattage load for the water heater are specified on the rating plate on the front of the water heater.

NOTICE: This guide recommends minimum branch circuit sizing and wire size based on National Electric Code. Refer to wiring diagrams in this manual for wiring connections.

NOTE: When sizing the breaker and wire for over current protection, include an additional 500W to the upper element wattage rating. This will account for the maximum amperage draw of the compressor and fan motor.

- **DO NOT** turn on the electrical supply or operate this water heater unless it is completely full of water.

- **CAUTION:** The presence of water in the piping and water heater does not provide sufficient conduction for a ground. Non-metallic piping, dielectric unions, flexible connectors etc. can cause the water heater to be electrically isolated.

- **WARNING:** If local codes require external application of insulation blanket kits the manufacturer's instructions included with the kit must be carefully followed.

Insulation Blankets

Insulation blankets, available to the general public, for external use on electric water heaters are not necessary. The purpose of an insulation blanket is to reduce the standby heat loss encountered with storage tank heaters. This water heater meets or exceeds the National Appliance Energy Conservation Act standards with respect to insulation and standby loss requirements making an insulation blanket unnecessary.

The manufacturer’s warranty does not cover any damage or defect caused by installation, attachment or use of any type of energy saving or other unapproved devices (other than those authorized by the manufacturer) into, onto or in conjunction with the water heater. The use of unauthorized energy saving devices may shorten the life of the water heater and may endanger life and property.

The manufacturer disclaims any responsibility for such loss or injury resulting from the use of such unauthorized devices.

- **CAUTION:** If local codes require the application of an external insulation blanket to this water heater, pay careful attention to the following so as not to restrict the proper function and operation of the water heater:
  - **DO NOT** cover the operating or warning labels attached to the water heater or attempt to relocate them on the exterior of insulation blanket.
  - **DO NOT** cover air openings on both sides of the water heater.
  - **DO NOT** cover the Controller Assembly, temperature and pressure relief valve or drain valve.
  - Inspect the insulation blanket frequently.
Hot and Cold Pipe Insulation Installation

Install the insulation on the cold water supply inlet and the hot water outlet as shown in the illustration.
Installing the water heater

Ducting Requirements
Always check with local building and HVAC codes before designing the duct system.
The water heater may be ducted to the outdoors or another space as described in these instructions. Ducting configurations that do not comply with these guidelines are not supported.
DO NOT connect this water heater to existing duct work; it must be ducted separately from other appliances.
Ducting approved for HVAC applications is required.
Ducting must be adequately supported along both vertical and horizontal lengths.
UL Certified terminations must be used for ducting to the outside. These terminations have been evaluated to ensure there is sufficient protection from rain water entry and resistance to air flow is minimized.
Indoor registers approved for HVAC applications is required.
Rigid ducting must be isolated from floor joists or other structural members to minimize the transmission of noise and vibration. A short section (12 inch minimum) of flexible duct must be used between the water heater and rigid ducting as an isolation method.
Every foot of flexible ducting counts as three feet of rigid ducting.
Ducting must be insulated per HVAC codes (to prevent condensation).
Ensure cold air exhaust is sufficiently away from structures to prevent condensation on surfaces.
Maximum heater performance is obtained by lowering the resistance to air flow (regular filter maintenance is beneficial) and providing the unit with warm moist air.
Considerations when planning the duct system:
• Run the ducting the most direct route possible.
• Limit the number of elbows/bends.
• Use the largest duct size possible.
• Use the largest termination possible.
• Consider placement and direction of terminations (reduce recirculation of exhaust into the intake).
Calculated length of duct is the length on the inlet plus the length on the outlet. Any combination of duct lengths on the inlet and outlet is supported up to the maximum duct length (Table 1).

Duct System Configuration
The inlet and outlet ducting connections on the water heater accepts 8 inch diameter ducting. No additional adaptors are needed.
7 inch, 6 inch, 5 inch diameter ducting is supported. Table 1 lists the total feet of ducting allowed. For duct diameters smaller than 8 inch diameter, Table 1 takes into account the duct reducer(s) and up to 10 feet of 8 inch rigid ducting (two elbows) before the duct reducer(s) at the unit. Duct Reducers must be installed within 10 feet (two elbows) of the unit or within 2 feet of the end of the duct.

<td>65'</td>
<td>25'</td>
<td>--</td>
</tr>
</tbody>
</table>
Equivalent feet for Duct Accessories

Elbows/Bends

Rigid duct elbows and flex bends greater than 45° is considered an elbow.

Flexible ducting bends’ inner radius cannot be less than its diameter. If bends with tighter radii are needed, a rigid elbow must be used.

Maximum number of elbows/bends allowed are shown in [brackets] in Table 2.

Terminations/Registers

Table 2 equivalent feet for terminations includes the rodent screen.

For terminations and registers with smaller diameters than the duct diameter, Table 2 accounts for the duct reducer and termination/register. Smaller diameter terminations and registers with more than a 2 ft. connection is not supported.

Damper

If ducting to the outside using an exhaust duct only (no intake duct), an approved Rheem damper should be installed no further than 10 ft. of rigid ducting total (two elbows equivalent) from the unit. This prevents outside air from coming into the living space. If ducting air from the outside to the inlet of the heater, no provision is made to prevent outside air from flowing into the living space.

Installing the water heater

Ducting Example:

1. Exhaust/Inlet or both? Both, Inlet and Outlet
2. Ducting to outside of building or another room? Outside building.
3. Length of duct from water heater to termination? 20 ft.
5. Diameter of ducting used? 8 in. Diameter
7. Number of elbows/bends? 3 Total – One on inlet and Two on Outlet

I. Does calculated ducting length exceed maximum allowable table?
   a. 20 ft. (Outlet duct length)
   b. 10 ft. (1 rigid elbow and 1 bend on outlet)
   c. 20 ft. (reduced diameter termination outlet)
   d. 20 ft. (Inlet duct length)
   e. 5 ft. (1 Bend on inlet)
   f. 20 ft. (reduced diameter termination inlet)
   g. Total = 20+10+20+20+5+20 = 95 ft.

Using flexible 8 in. diameter duct, the maximum duct length allowed is 125 ft.; therefore, because 95 ft. is less than 125 ft., this is an acceptable ducting configuration.

Accessory Kits SP20887 (2 Kits), SP20889 (2 Kits) and SP20890 (1 Kit) are available for this installation.

Horizontal Duct Installation

Once the duct terminal location has been determined, make a hole through the exterior wall to accommodate the UL Certified Termination. Termination must exit exterior wall horizontally only.

Complete rest of the duct pipe installation to the water heater’s duct connector fitting.

If necessary, support horizontal run as previously mentioned.
Installation Checklist

A. Water Heater Location

- Close to area of heated water demand.
- Indoors and protected from moisture, wet conditions, freezing temperatures (below 32°F (0°C)) and High temperatures (above 140°F (60°C)).
- Area free of flammable vapors.
- Provisions for Air Circulation (Louvered doors on ducting).
- Provisions made to protect area from water damage.
- Sufficient room to service heater.
- Six inches (6") of clearance from ceiling to top of Hybrid Water Heater to allow for filter maintenance.
- Access to condensate disposal.
- Vibration Isolation Kit (Non-Concrete floors).
- Hybrid seismic Kit (if required).

B. Water Supply

- Water heater completely filled with water.
- Air purged from water heater and piping.
- Water connections tight and free of leaks.
- Flexible water connections.

C. Relief Valve

- Temperature and Pressure Relief Valve properly installed and discharge line run to open drain.
- Discharge line protected from freezing.

D. Wiring

- Power Supply voltage agrees with water heater rating plate.
- Branch circuit wire and fusing or circuit breaker of proper size. (Recommended 15 amp & 30 amp breaker for select models).
- Electrical connections tight and unit properly grounded.
- 10 gauge wire.

E. Condensate Lines

- Condensate lines from heat pump installed correctly.
- Condensate lines from heat pump run to a suitable drain location.

F. Ducting

- HVAC approved ducting.
- Calculated length of duct no greater than maximum allowed.
- UL Certified terminations (For ducting to the outside).
- Insulated duct.
- Ducting adequately supported.
- Ducting adequately isolated from structure.

G. Shutoff Valve

- Make sure valve is open condition.

H. Leak Sensor

- Make sure sensor is dry and doesn't touch the water during installation.
Operating the water heater

⚠️ CAUTION: Hydrogen gas can be produced in a hot water system served by this water heater that has not been used for a long period of time (generally two weeks or more). HYDROGEN GAS IS EXTREMELY FLAMMABLE!! To dissipate such gas and to reduce risk of injury, it is recommended that the hot water faucet be opened for several minutes at the kitchen sink before using any electrical appliance connected to the hot water system. If hydrogen is present, there will be an unusual sound such as air escaping through the pipe as the water begins to flow. DO NOT smoke or use an open flame near the faucet at the time it is open.

Safety Precautions

A Disconnect all power to water heater if it has been subjected to over heating, fire, flood, physical damage.
B DO NOT turn on water heater unless it is filled with water.
C DO NOT turn on water heater if cold water supply shut-off valve is closed.
D If there is any difficulty in understanding or following the Operating Instructions or the Care and Cleaning section, it is recommended that a qualified person or serviceman perform the work.

⚠️ WARNING: If the water heater has been subjected to fire, flood or physical damage, disconnect all power to water heater, and DO NOT operate the water heater again until it has been checked by a qualified service technician.

NOTICE: DO NOT use this appliance if any part has been under water. Immediately call a qualified installer or service agency to replace a flooded water heater. DO NOT attempt to repair the unit! It must be replaced.

Safety Controls

The water heater is equipped with a temperature limiting control (ECO) that is located above the upper heating element in contact with the tank surface. If for any reason the water temperature becomes excessively high, the temperature limiting control (ECO) breaks the power circuit to the heating element. Once the control opens, it must be reset manually.

⚠️ CAUTION: The cause of the high temperature condition must be investigated by qualified service technician and corrective action must be taken before placing the water heater in service again.

To reset the temperature limiting control: (Refer to Illustration in Cavity Insert section):

1. Disconnect all power to unit before starting maintenance.
2. Remove the upper cavity cover and insulation.
3. Press the red RESET button.
4. Replace the insulation, jacket access panel and plastic housing before turning on the power to the water heater.

⚠️ DANGER: There is a hot water scald potential if the thermostat is set too high. Households with small children, disabled, or elderly persons may require a 120°F (49°C) or lower thermostat setting to prevent contact with HOT water.

Water Temperature Setting

The temperature of the water in the water heater can be regulated by selecting the desired temperature on control display. Safety and energy conservation are factors to be considered when selecting the water temperature setting of the water heater. The lower the temperature setting, the greater the savings in energy and operating costs.

To comply with safety regulations the temperature is factory set at 120°F (49°C) or less where local codes require. This is the recommended starting point. Water temperatures above 125°F (52°C) can cause severe burns or death from scalding. Be sure to read and follow the warnings outlined in this manual and on the label on the water heater. This label is located on the front of the water heater.

Mixing valves are recommended for reducing point of use water temperature to mixing hot and cold water in branch water lines. It is recommended that a mixing valve complying with the Standard for Temperature Actuated Mixing Valves for Hot Water Distribution Systems, ASSE 1017 be installed. See page 3 for more details and contact a licensed plumber or the local plumbing authority for further information.

When used in demand response applications a thermostatic mixing valve conforming to ASSE 1017 shall be installed on the hot water supply line following all manufacturer installation instructions. See page 32 for additional installation information.

The chart on the page 3 may be used as a guide in determining the proper water temperature for your home.
ICONS show the current state of the entire system.

1. **Current Mode** - Illuminated when the system is working on the corresponding mode.
2. **Wi-Fi Indicator** - Illuminated when the display detects valid connection to a Wi-Fi network. Blinking when in provisioning mode.
3. **Fault Indicator** - Illuminated when the display detects OBJECT codes ALMCODE 1, 2, 3 or 4 is greater than "0". This indicates the Control Board has detected either an Alarm or an Alert.
4. **Scroll Available Indicator** - Illuminated when the display detects the Up/Down arrows are enabled to scroll.
5. **Scald Warning** - Illuminated when the display detects potential scalding water temperatures. Use water at own risk.
6. **Enable/Disable Indicator** - Illuminated when the display is Enabled (ON).
Local Startup

Enabling / Disabling Unit

1) Press the "ON/OFF" button to turn on / enable unit.
   *Unit will be disabled upon initial startup.

2) Press the "ON/OFF" button to turn off / disable the unit.

Adjusting Temperature

1) Press the "UP" button to increase temperature.

*Scald warning will automatically appear at 120°F and higher.

2) Press the "DOWN" button to decrease temperature.

*Scald warning will automatically appear at 120°F and higher.

High Temperature Enabling

Enable high temperatures (+140°) by pressing and holding both "UP" and "DOWN" buttons for 3 seconds when temperature is set to 140°F.

*Maximum Temperature: 150°F (65°C). High Temperature Setting will be disabled after 5 minutes if the user decreases the temperature below 140°F (60°C).

Lock/Unlock Display

- Press and hold for 5 seconds both UP and DOWN buttons to Lock / Unlock the Display. This prevents any change in Mode of operation or set-point if any button is pressed.
Change Mode of Operation

Press the "MODE" button to select operating mode.

Modes of Operation

- Energy Saver
- High Demand
- Heat Pump
- Electric
- Vacation

<table>
<thead>
<tr>
<th>Mode</th>
<th>Efficiency</th>
<th>Recovery</th>
</tr>

</tr>
</tbody>
</table>

Setting Menu

Press the "NEXT" button to access the settings.

Keep pressing "NEXT" button to scroll through the following menu items:

1. ALARM BEEP: Enable/Disable Alarm Sound.
   a. Use the Up/Down arrows to change from Yes (Default) to No sound.
2. TEMP DISPLAY: Change the temperature units (°F or °C).
   a. Use the Up/Down arrows to change from F° (Default) to °C.
3. CURRENT ALARMS
   a. Use the Up/Down arrows to scroll through the current alarms.
   b. To clear alarms press the Clear Alarm button.
4. ALARM HISTORY
   a. Use the Up/Down arrows to scroll through the alarm history.
5. CLEAR HISTORY
   a. Press ENTER to clear alarm history.
6. MAC ADDRESS: WiFi MAC Address.
7. NETWORK INSTANCE: Instance of the current unit.
   a. Use the Up/Down arrow to change Network Instance if needed.
8. SOV INSTALLED:
   a. A Shut-Off Valve (SOV) is installed? - This will say yes if a SOV is installed.
Local Startup

WiFi Setup
1. Press, hold for 5 seconds and release the WiFi button.
2. WiFi LED will start to blink when it is ready to start WiFi setup.
3. WiFi signal will start to broadcast for 30 minutes and user can use EcoNet Application to setup WiFi.
4. If setup is not completed in the next 30 minutes, WiFi will stop broadcasting. User should perform these steps again to re-start WiFi setup.
5. Once correctly connected, LED will turn solid blue.

WiFi Soft Reset
If WiFi needs to be reset while keeping the same WiFi login information:
1. Press, hold for 3 seconds and release the WiFi button. 1 beep will be heard.
2. WiFi will try to re-connect to the same network that was configured previously.

WiFi Hard Reset
If WiFi needs to be reset because there is a new network to be used:
1. Press, hold for 5 seconds and release the WiFi button. 3 beeps will be heard.
2. Follow the same steps as in WiFi Setup section.
EcoNet App

EcoNet App 2.0 Instructions

Download EcoNet app and create profile

1. Open and log into your EcoNet app and select the “Add Product” option on the main equipment screen.

2. Add a location by either selecting “Use my current location” or entering your zip code, then hit “Next”.

3. Place your Water Heater in WiFi setup and click the “Continue” button.

4. Select your WiFi module’s mac address from the network list. You can find your MAC address in the Water Heater WiFi menu.
EcoNet App

5. Return to the app, where you should see the following screen. Click “Available Networks”.

6. Select your router and enter your password. Click “Connect”.

7. The app should proceed to provision your WiFi module using a secure connection. You should see a message shown in the image on the left.

8. Once connected, product home screen will be displayed.
Care and cleaning of the water heater

Draining the Water Heater

⚠️ CAUTION: Shut off power to the water heater before draining water.
⚠️ DANGER: Before manually operating the relief valve, make certain no one will be exposed to the hot water released by the valve. The water drained from the tank may be hot enough to present a scald hazard and should be directed to a suitable drain to prevent injury or damage.

In order to drain the water heater, turn off the cold water supply. Open a hot water faucet or lift the handle on the relief valve to admit air to the tank. Attach a garden hose to the drain valve on the water heater and direct the stream of water to a drain. Open the valve.

Routine Preventative Maintenance

⚠️ DANGER: Before manually operating the relief valve, make certain no one will be exposed to the danger of coming in contact with the hot water released by the valve. The water may be hot enough to create a scald hazard. The water should be released into a suitable drain to prevent injury or property damage.

NOTICE: If the temperature and pressure relief valve on the water heater discharges periodically, this may be due to thermal expansion in a closed water system. Contact the water supplier or your plumbing contractor on how to correct this. DO NOT plug the relief valve outlet.

Properly maintained, your water heater will provide years of dependable trouble-free service.

It is suggested that a routine preventive maintenance program be established and followed by the user.

Most electrical appliances, even when new, make some sound when in operation. If the hissing or singing sound level increases excessively, Contact a qualified installer or plumbing contractor to inspect.

IMPORTANT: See "DANGER on left". At least once a year, lift and release the lever handle on the temperature pressure relief valve, located on the side of the water heater, to make certain the valve operates freely. Allow several gallons to flush through the discharge line to an open drain.

It is recommended to clean the filter on top of the heat pump when "Clean filter reminder" alert appears. Clean by washing with mild detergent and water. Dry and replace. Remove the filter by lifting up, then replace by lowering back into the filter slot on top of the unit. See Figure below.

At least once a year pour a cup of bleach in the access opening of the condensate drain to kill any algae, mold, or mildew that has formed in the pipe. Ensure the condensate can flow freely; unplug if needed.

A water heater's tank can act as a setting basin for solids suspended in the water. It is therefore not uncommon for hard water deposits to accumulate in the bottom of the tank. It is suggested that a few quarts of water be drained from the water heater's tank every month to clean the tank of these deposits.

Rapid closing of faucets or solenoid valves in automatic water using appliances can cause a banging noise heard in a water pipe. Strategically located risers in the water pipe system or water hammer arresting devices can be used to minimize the problem.
Care and cleaning of the water heater

**Vacation and Extended Shut-Down**

If the water heater is to remain idle for an extended period of time, the power and water to the appliance should be turned off to conserve energy and prevent a build-up of dangerous hydrogen gas.

The water heater and piping should be drained if they might be subjected to freezing temperatures.

After a long shut-down period, the water heater’s operation and controls should be checked by qualified service personnel. Make certain the water heater is completely filled again before placing it in operation.

**Anode Rod**

This water heater is equipped with an anode rod designed to prolong the life of the glass-lined tank. The anode rod is slowly consumed, thereby eliminating or minimizing corrosion of the glass-lined tank.

Water sometimes contains a high sulfate and/or mineral content and together with cathodic protection process can produce a hydrogen sulfide, or rotten egg odor in the heated water. Chlorination of the water supply should minimize the problem.

**NOTICE: Refer to the Hydrogen Gas Caution in the Operating Instructions.**

**NOTICE: DO NOT remove the anode rod from the water heater’s tank. Operation with the anode rod removed will greatly shorten the life of the glass lined tank and will exclude warranty coverage.**
Troubleshooting Tips
Save time and money! Review the chart on this page first and you may not need to call for service.

⚠️ **CAUTION:** For your safety **DO NOT** attempt repair of electrical wiring, thermostats, heating elements or other safety devices. Refer repairs to qualified service personnel.
Troubleshooting Alarm Codes

Troubleshooting Tips
Save time and money! Review the charts on this section first and you may not need to call for service.

The water heater will make an audible beep for notification of Alarms and ▲ icon. The following steps should be used in determining the Alarm code:

1) Press "Next" button until "Current Alarm" is visible.

2) Press "Down" arrow button to scroll through the active alarms.

A separate branch circuit with copper conductors, overcurrent protective device and suitable disconnecting means must be provided by a qualified electrician.

All wiring must conform to local codes or latest edition of National Electrical Code ANSI/NFPA 70.

1. Use an appropriately sized wire nut to connect the Red wire of the CTA module box to the Red wire of the Water Heater connection.

2. Use an appropriately sized wire nut to connect the Black wire of the CTA module box to the Black wire of the Water Heater connection.

3. Use the ground screw to connect the green wire of the CTA module box to ground.

4. The water heater is completely wired to the junction box inside jacket at the top front of the water heater.

*Note: A CTA2045 compliant Module can be connected to the water heater’s top connector. Follow the instructions from the CTA2045 Module supplier to connect.
Before uploading and enabling JA13 offline schedule (Utility Contractor Only):
1. Power ON Water Heater.
2. Press, hold for 5 seconds and release the WiFi button.
3. WiFi LED will start to blink when it is ready to start WiFi setup.
4. WiFi signal will start to broadcast for 30 minutes and user can use the EcoNet Contractor Portal and Contractor Application to setup JA13 Offline Schedule.
5. If setup is not completed in the next 30 minutes, WiFi will stop broadcasting. User should go to these steps again to re-start WiFi setup.
6. Once setup is completed, the Demand Response Icon will light up which will indicate the Water Heater is following a schedule.

To override JA13 offline schedule:
1. The user can override the JA13 offline schedule for 72 hrs by pressing the MODE button and changing the Mode of operation of the water heater to the user desired Mode and set-point.
2. Once the user override Time elapses, the Demand Response will continue to follow the predetermined schedule.
3. To completely opt-out from JA13 scheduling, contact your utility company.

To replace the battery follow these steps:
1. Remove the front cover of the Control assembly.
2. Remove the BR2032 battery from the battery holder.
3. Replace the battery with an approved BR2032 cell coin battery.
4. Re-Install the front cover of the Control assembly.
A thermostatic mixing valve conforming to ASSE 1017 shall be installed on the hot water supply line following all manufacturer installation instructions.

Nominal 3/4” size mixing or tempering valve (refer to warning above). Follow mixing or tempering valve manufacturer’s instructions for installation of the valve.

3/4” Tempered domestic hot water supply to house

Hot Water Outlet

Cold Water Inlet
Replacement Parts.

Instructions For Placing a Parts Order

Address parts orders to the distributor or store where the heater was purchased.

All parts orders should include:

1. The model and serial number of the water heater from the rating plate located on the tank jacket.
2. Specify voltage and wattage as marked on the rating plate.
3. Part description (as noted below) and number of parts desired.

*NOTICE: Check the water heater’s rating label on the front of the unit for the acceptable element wattage.

⚠️ CAUTION: For your safety DO NOT attempt repair of electrical wiring, heating elements, heat pump or electronic controls. Refer repairs to qualified service personnel.

⚠️ WARNING! FLAMMABLE CONTENTS UNDER PRESSURE. The compressor is not a serviceable part. The compressor wiring terminals may be allowing pressurized refrigerant and oil to escape, ignite and cause serious bodily injury, severe burns or death.

Cavity Insert Instructions

The following instructions are intended for qualified service personnel ONLY, and should only be done when necessary.

In order to replace the ECO, thermistor or heating element, remove the cavity insert crossbar by following the instructions below:

1. Disconnect all power to unit before to starting maintenance.
2. Remove the jacket access panel(s) and insulation.
3. Rotate the crossbar up and down until it breaks away from the remainder of the cavity insert. (See illustration to the left)
4. Discard the crossbar. It cannot and need not be replaced.
   Replace the ECO, thermistor and/or element as necessary.
5. Replace the insulation, jacket access panel(s) and plastic housing before turning on the power to the water heater.

NOTICE: The cavity insert crossbar is necessary for the manufacturing process only. The removal of the crossbar will not interfere with the operation of the water heater.
IF YOU NEED SERVICE

1. Should you have any questions about your new water heater, or if it requires adjustment, repair, or routine maintenance, it is suggested that you first contact your installer, plumbing contractor or previously agreed upon service agency. In the event the firm has moved, or is unavailable, refer to the telephone directory, commercial listings or local utility for qualified service assistance.

2. Should your problem not be solved to your complete satisfaction, you should then contact the Manufacturer’s National Service Department at the following address:
   800 Interstate Park Drive
   Montgomery, Alabama 36109
   Phone: 1-800-432-8373.
   When contacting the manufacturer, the following information will be requested:
   a. Model and serial number of the water heater as shown on the rating label located on front of the water heater.
   b. Address where the water heater is located and physical location.
   c. Name and address of installer and any service agency who performed service on the water heater.
   d. Date of original installation and dates any service work was performed.
   e. Details of the problems as you can best describe them.
   f. List of people, with dates, who have been contacted regarding your problem.

3. Should you have any issue or need assistance with the WiFi Module/EcoNet App then contact the EcoNet Customer Service:
   Phone: 1-800-255-2388
   Website: www.Rheem.com/EcoNet
